

You want to hack the Mexican government

▶ You receive an e-mail on your inbox.

You logon into the server.

```
. . .
                        omardil — vim — 86×35
      antiatetateta anna an """ anthateta.
    ...:
       .::
      :::
      \vdots
This is the Mexican Government central server. Access beyond this point is considered
highly restricted and confidential.
If you have no business being here, exit immediately.
Access denied. Enter first 5 digits of PI to authenticate.
-- INSERT --
```

You remember that you can use the Leibnz formula to approximate the first 8 values for PI.

$$1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \dots = \frac{\pi}{4}.$$

Design a method that prints the value of PI, calculating it with a precision of 10000 elements of the Leinbz series.

$$1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \dots = \frac{\pi}{4}.$$
